September 2013

<http://lazowska.cs.washington.edu/NSB.pdf>

This morning ...

- Why must America remain the world leader in computer science?
- How did we gain the lead, and how can we retain it?
- How should our competitiveness be defined?
- The coming decade: Dramatic improvements in technology and algorithms enable "smart everything"
- Cyberinfrastructure to support 21st century "smart discovery"
 - Implications for academia
 - Implications for research policy
 - Implications for K-12 education

REPORT TO THE PRESIDENT
AND CONGRESS

DESIGNING A DIGITAL FUTURE:
FEDERALLY FUNDED RESEARCH
AND DEVELOPMENT IN
NETWORKING AND INFORMATION
TECHNOLOGY

Executive Office of the President
President's Council of Advisors on
Science and Technology

DECEMBER 2010

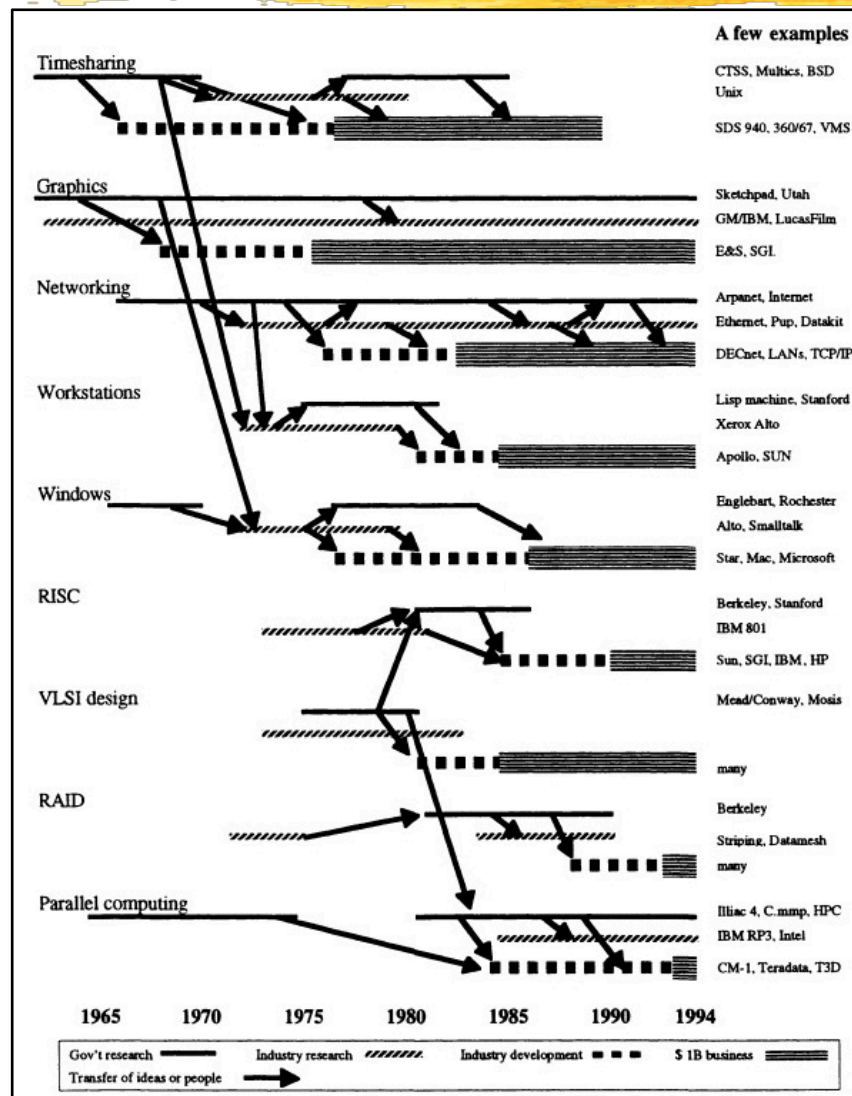

Why must America remain the world leader in computer science?

- "A key driver of economic competitiveness"
- "Crucial to achieving our major national and global priorities in areas such as energy and transportation, education and life-long learning, healthcare, and national and homeland security"
- "Accelerates the pace of discovery in nearly all other fields"
- "The dominant factor in America's science and technology employment"
- An intellectual agenda "as rich as that of any other field of science or engineering"

How did we gain the lead, and how can we retain it?

1995

Innovation
in INFORMATION
TECHNOLOGY

IT Sectors With Large Economic Impact

Motorola AMD Intel eBay Akamai Yahoo! IBM Electronic Arts
 Qualcomm HP Symantec Juniper Facebook Twitter VMware HP Adobe Autodesk
 Texas Instruments Apple Cisco Amazon Microsoft Oracle nVidia Pixar Xbox
 iPhone nVidia Dell Google iRobot
 Intuitive Surgical

Continuing
Innovation
 IN INFORMATION TECHNOLOGY

■ Key takeaways:

- America is the world leader in information technology due to a rich interplay of government, academia, and industry
- Every major market segment bears the clear stamp of Federal research investments
- The path from research to major market segment is not linear: ideas and people flow in all directions
- Unanticipated results are often as important as anticipated results
- The interaction of research ideas multiplies their impact
- Entirely appropriately, corporate R&D is very heavily tilted towards D: engineering the next release of a product, vs. a 5- 10- or 15-year horizon

How should our competitiveness be defined?

- "At the time of the High-Performance Computing Act of 1991, the importance of high performance computing and communication (HPCC) to scientific discovery and national security was a major factor underlying the special attention given by Congress to NIT. Although HPCC continues to contribute in important ways to scientific discovery and national security, many other aspects of NIT have now risen to comparable levels of importance."

N.B. This does not say that the importance of HPCC is decreasing! It simply notes that other aspects of the field have risen to comparable levels of importance, and must be weighed in assessing our competitiveness.

The coming decade: Dramatic improvements in technology and algorithms enable "smart everything"

- A proliferation of sensors
 - Think about the sensors on your phone
- More generally, the creation of almost all information in digital form
 - It doesn't need to be transcribed in order to be processed
- Dramatic cost reductions in storage
 - You can afford to keep all the data
- Dramatic increases in network bandwidth
 - You can move the data to where it's needed

- 
- Dramatic cost reductions and scalability improvements in computation
 - With Amazon Web Services, or Google App Engine, or Microsoft Azure, 1000 computers for 1 day costs the same as 1 computer for 1000 days
 - Dramatic algorithmic breakthroughs
 - Machine learning, data mining - fundamental advances in computer science and statistics

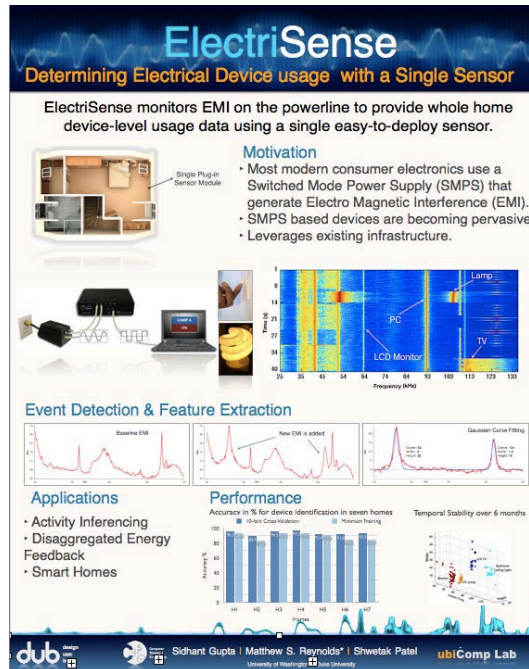

The “big data” revolution is what actually puts the “smarts” in “smart everything”

SLOAN DIGITAL SKY SURVEY

eScience is enabled by *data* more than by cycles

- Massive volumes of data from sensors and networks of sensors

Astronomy: LSST

Physics: LHC

Oceanography: OOI

Sociology: The Web

Biology: Sequencing

Economics: POS terminals

Neuroscience: Hawkmoths

eScience is about the *analysis* of data

- The semi-automated extraction of knowledge from massive volumes of data
 - There's simply too much of it - and it's too complex - to explore manually
- It's not just a matter of volume - it's "the 3 V's":
 - Volume
 - Velocity (rate)
 - Variety (dimensionality / complexity)
- It's not just a matter of data movement and data storage - it's about data *analysis* - "from data to knowledge to action"

eScience utilizes a spectrum of computer science techniques and technologies

- Sensors and sensor networks
- Backbone networks
- Databases
- Data mining
- Machine learning
- Data visualization
- Cluster computing at enormous scale (the cloud)
- Collaboration and crowd sourcing

eScience is married to the cloud: Scalable computing and storage for everyone

eScience will be pervasive

- Simulation-oriented computational science has been transformational - and will continue to be of great importance - but it has *not* been pervasive
 - As an institution (e.g., a university), you didn't need to excel in order to remain competitive
- eScience capabilities must be broadly available in any institution
 - If not, the institution will simply cease to be competitive

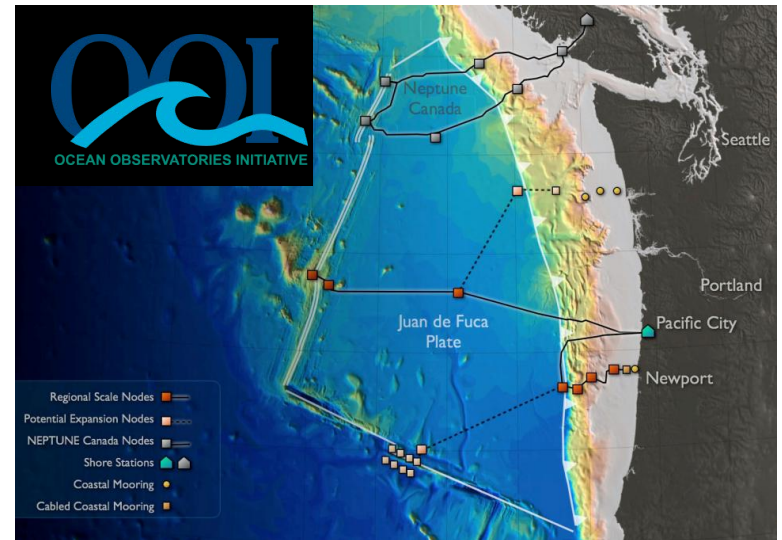

My personal story, and the story of the UW eScience Institute

UW eScience Institute

- *"All across our campus, the process of discovery will increasingly rely on researchers' ability to extract knowledge from vast amounts of data... In order to remain at the forefront, UW must be a leader in advancing these techniques and technologies, and in making [them] accessible to researchers in the broadest imaginable range of fields."*
- In other words:
 - Data-intensive discovery will be ubiquitous
 - We must be a leader in inventing the capabilities
 - We must be a leader in translational activities - in putting these capabilities to work
 - It's about *intellectual infrastructure* (human capital) and *software infrastructure* (shared tools and services - digital capital)

This was not as broadly obvious in 2005 as it is today

■ But we asked UW's leading faculty - across all ages and fields, regardless of "label" - and they confirmed this view of the future

■ *From the start, this effort has been bottom-up, needs-based, driven by the scientists*

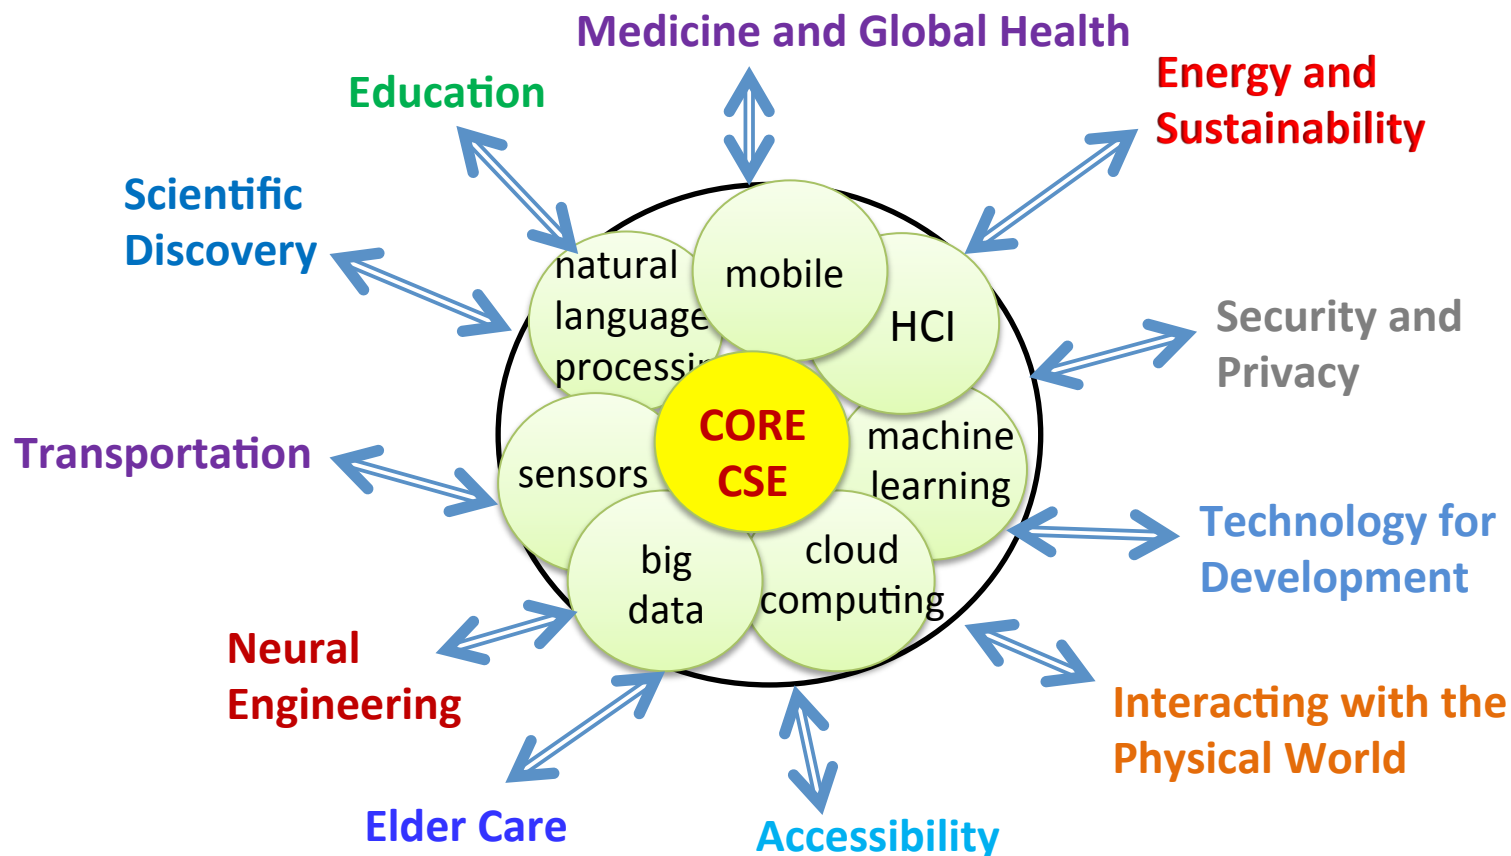

We're at the dawn of a revolutionary
new era of discovery and of learning

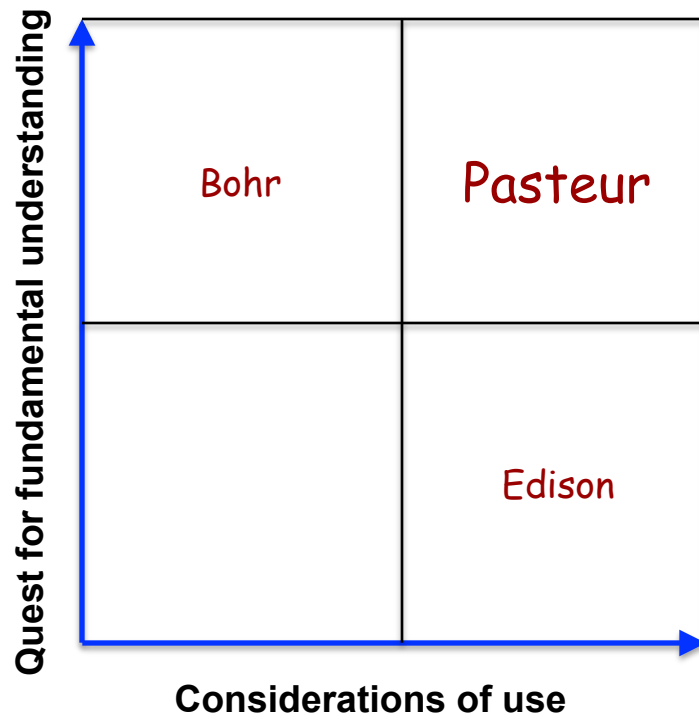

Implications for academia

■ A modern view of computer science

- On the methodology side, seek faculty in “Pasteur’s quadrant”

- 
- Strive to educate students who are “Pi-shaped”

Credit: Alex Szalay, Johns Hopkins University

■ Resurrect the water cooler! (Data is today's unifying force!)

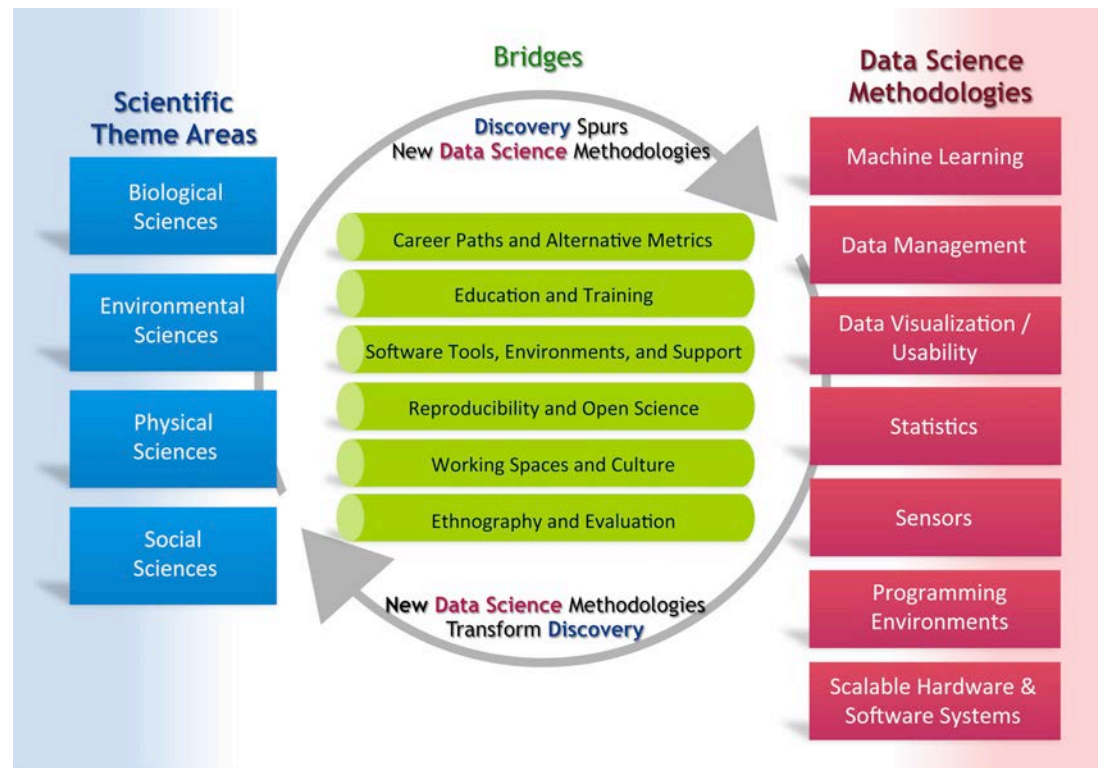

Implications for research policy

- NSF has a unique role in driving advances in computer science
 - Computer Science does not have an NIH or a Department of Energy
 - NSF provides 75% of Federal support for academic computer science research
- Other fields are becoming *information* fields, not just computational fields
 - The *intellectual approaches* of computer science are as important to advances as is cyberinfrastructure
 - *New approaches* will enable *new discoveries*

- 
- Meeting evolving cyberinfrastructure needs requires *research*, not merely procurement
 - This is true for HPC ... and for data-intensive discovery ... and for cyber-enabled advances in education and assessment
 - Meeting evolving cyberinfrastructure needs requires investment in *intellectual* as well as physical infrastructure

- Advancing data-intensive discovery requires broad-based programs that strive to create a “virtuous cycle” - and that drive *institutional change*

- 
- Nationally and institutionally, there are various policies that distort behavior
 - One example: Appropriate use of cloud resources is discouraged by
 - Indirect cost on services
 - MRI viewed as a pot separate from Directorates/Divisions
 - Institutional subsidies (power, cooling, space)

Implications for K-12 education

Computer Science in K-12, 1983

A Nation At Risk

Our Nation is at risk. Our once unchallenged preeminence in commerce, industry, science, and technological innovation is being overtaken by competitors throughout the world. This report is concerned with only one of the many causes and dimensions of the problem, but it is the one that undergirds American prosperity, security, and civility.

If an unfriendly foreign power had attempted to impose on America the mediocre educational performance that exists today, we might well have viewed it as an act of war. As it stands, we have allowed this to happen to ourselves.

Recommendation A: Content

We recommend that State and local high school graduation requirements be strengthened and that, at a minimum, all students seeking a diploma be required to lay the foundations in the Five New Basics by taking the following curriculum during their 4 years of high school: (a) 4 years of English; (b) 3 years of mathematics; (c) 3 years of science; (d) 3 years of social studies; and (e) one-half year of computer science.

IBM PC XT

- In 9 out of 10 high schools nationwide, computer science is not offered
- In 36 of the 50 states, computer science does not count towards the math or science graduation requirement

Yet computer science - "computational thinking" - is a key capability for just about every 21st century endeavor

Is this a great time, or what?!?!

<http://lazowska.cs.washington.edu/NSB.pdf>
